

Validate Gedcom compliance and data consistency

This tool checks your genealogy data for anomalies, in terms of incompatibility with the **Gedcom standard** and in case of **genealogical inconsistencies**.

Description

The window displays a control report.

A table of contents lists the different types of controls performed, for which at least one anomaly has been detected, and the number of corresponding entities is in brackets.

Then the sections follow. In each section, you have the list of entities in anomaly.

Each entity number can be clicked. It selects the entity in the Ancestris views so you can see the details.

Usage

This tool covers two major needs.

- a need for transmission and durability of your genealogy, since it enables you to respect the Gedcom standard as closely as possible
- a need to control the data that has been entered

Depending on the size of your genealogy file, a progress bar appears to perform the whole analysis.

The report is then displayed.

Click on the entity numbers to display them in the editors and correct any anomalies.

After correcting several anomalies, you can restart a new report that will present the remaining anomalies.

You can also change the thresholds for triggering anomalies using the preference settings described below.

You can ignore an anomaly for a given tag using with a `_VALID` tag placed under the tag that generates the anomaly.

- For instance, if twins are born on different days and you want to avoid the anomaly and confirm this is correct, just add the `_VALID` tag underneath the `FAM:CHIL` of both twins.
- Also, to confirm a couple with too many years appart, add `_VALID` underneath the `FAM:HUSB` and `FAM:WIFE` tags.
- You may want to add a `NOTE` as well to explicit your confirmation.

Customization

The controls to be performed are linked to the Preferences settings, Extensions pane, Validation tab.

They are pretty much self explanatory so we will not provide more details at this stage.

The screenshot shows the 'Preferences' dialog box with the 'Extensions' pane selected. The 'Validation' tab is active, displaying various validation settings. The 'Lifespan' section allows setting age ranges from 1 to 3000 years, with a maximum lifespan of 120. The 'Ages' section lists minimum and maximum ages for fathers, mothers, and siblings, as well as age differences between siblings and spouses, and ages for baptism, marriage, and retirement. The 'Family' section includes checkboxes for extramarital and same-sex families. The 'Places' section has a checkbox for places not matching header format. The 'Missing information' section includes checkboxes for private, empty, file not found, and isolated entities. The 'Gedcom' section includes checkboxes for underscore tags, property order, and anomalies. At the bottom are 'Export...', 'Import...', 'OK', 'Apply', and 'Cancel' buttons.
